Build your own illuminated SensingCube

STEP 1: First connect the Sensor
We use an accelerometer sensor to sense when you shake the cube.

STEP 2: Then connect the Light
The multicolour LED changes its colour depending on how fast you shake.

STEP 3: Plug in the battery
It provides power for your sensing circuit.

STEP 4: Clip in the two sides

① DEVICE - TO - PERSON

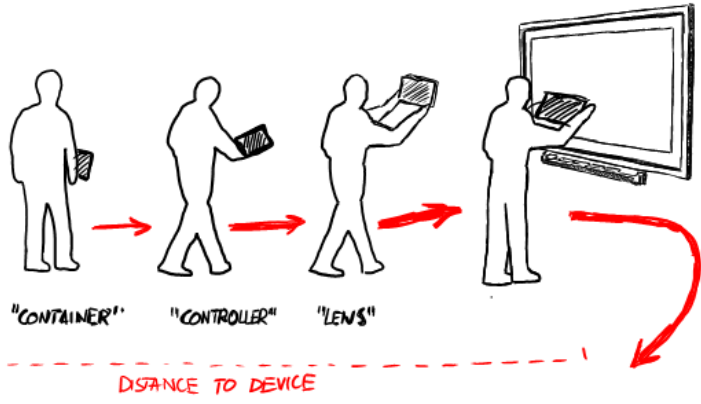

— relative orientation + distance to person

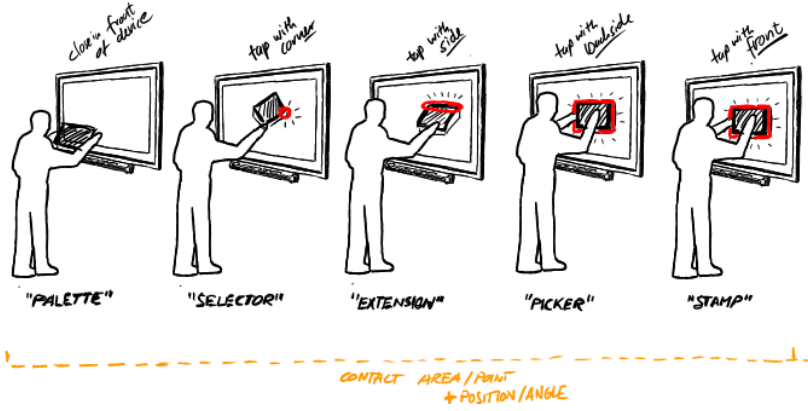

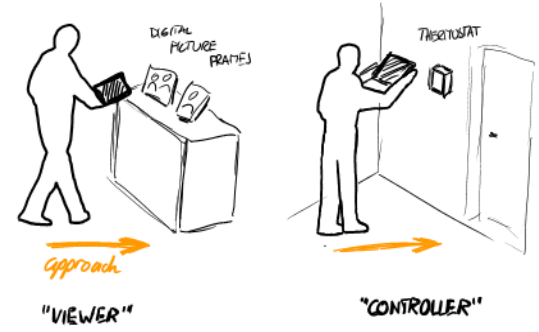

③ DEVICE - TO - NON DIGITAL OBJECTS / FIXED AND SEMIFIXED FEATURE SPACE

② DEVICE - TO - DEVICE

④ DEVICE - TO - INFORMATION APPLIANCES (subset of device-to-device?)

⑤ DEVICE - TO - FIXED FEATURE / ENVIRONMENT

⑥ DEVICE PROPERTIES

- visible
- activity
- owner
- people around
- global orientation (gyro + accel + compass)

Proxemics

An aerial, black and white photograph of a crowd of people. The image is overlaid with a large, dashed white line that forms a large circle. Three white rectangular boxes with black text are positioned within the circle. The background shows people from a high angle, some looking down, some looking up, and some in motion.

HuddleLamp: Spatially-Aware Mobile Displays for Ad-hoc Around-the-Table Collaboration

Rädle, R., Jetter, H.C., Marquardt, N., Reiterer, H., Rogers, Y. (2014) HuddleLamp: Spatially-Aware Mobile Displays for Ad-hoc Around-the-Table Collaboration. In Proceedings at ITS 2014, ACM (to appear).

Hybrid Sensing – RGB and Depth Tracking

Reflectance Properties

RGB Image

Confidence Image

Technical Evaluation – Results in Brief

- Accuracy of Hybrid Sensing < 1 cm
- Reliable tracking even when occluded
100% 1 finger, 99.9% 1 hand, and 89.8% 2 hands
- Unaffected by ambient light ranging
10 lux, 1600 lux, and 2200 lux
- Tracking framerate between 25 to 30 fps

HuddleLamp JavaScript API

Example JavaScript on client device

```
1. var huddle = Huddle.client()
2.   .on("devicefound", function() {
3.     console.log("devicefound");
4.   })
5.   .on("devicelost", function() {
6.     console.log("devicelost");
7.   })
8.   .on("proximity", function(data) {
9.     console.log(data);
10.  })
11.  .connect(host, port);
```

Proxemics as Analytical Tool

Proxemics as Analytical Tool

The screenshot displays the EXCITE software interface, which is used for analyzing proxemics data. The interface is divided into several key sections:

- a | View of multiple videos:** This section includes a thumbnail gallery on the left and a large video player on the right showing two individuals in a room. A "Load a video" button is located below the thumbnails.
- b | Queries for analyzing the event data:** A text box on the right contains several queries such as "Person 1 towards Person 2", "Person 1 towards Person's 2 tablet", "Person 2 towards Person 1", "Person 2 towards Person's 1 tablet", "Participants distance > 2 meters", "Participants distance > 1 meter and < 2", and "Participants distance < 1 meter". Below the queries are playback controls (play, stop, volume) and a "Comments:" field.
- c | Comments for coding:** This is the text input area for adding annotations to the event data.
- d | Timeline:** A horizontal timeline at the bottom shows event occurrences as colored bars (yellow, green, blue) across a time axis from 00:00 to 00:05. The events listed are:
 - Person 1 towards Person 2 (297)
 - 1 towards Person's 2 tablet (100)
 - Person 2 towards Person 1 (195)
 - Person 2 towards Person's 1 tablet (195)
 - Participants distance > 2 meters (28)
 - Participants distance > 1 meter and < 2 meters (547)
- e | Timeline scrubber:** A vertical line on the timeline indicates the current time position, which is approximately 00:01:30.
- f | Jumping forward and backward between events:** Small double-headed arrow icons are placed on the timeline bars to facilitate navigation between specific event points.
